

PRESTIGE EVENT AND RECEPTIONS

UNIVERSIDAD DISTRITAL FRANCISCO JOSE DE CALDAS

INTRODUCTION

Prestige Events is a software system designed to simplify the reservation, management, and customization of event packages. The goal of the application is to provide an intuitive interface for clients to choose event packages, verify availability, schedule dates, and manage their reservations easily.

GOALS

- Provide an intuitive interface for clients using a simple JavaFX prototype.
- Implement a robust three-layer architecture (Presentation, Business, Data).
- Ensure persistent storage of reservations and user data using local files.
- Apply SOLID principles to guarantee modular, maintainable, and scalable code.

FEATURES

Package Selection
Account System
Notifications
Persistent Storage

Presentation Layer

JavaFX controllers and views responsible for capturing user actions and displaying information.

2. Service Layer

Service classes implementing logic such as reservation validation, date checking, cancellation policies, and price calculations.

3. Data Layer

Repositories responsible for saving and retrieving information from files using a generic `FileRepository<T>`.

This architecture follows multiple SOLID principles, making the system modular, scalable, and easy to maintain.

RESULTS

- The layered architecture proved effective for maintaining clean separation of responsibilities.
- File persistence ensured stable storage of reservations and users across sessions.
- JavaFX provided an intuitive interface for interacting with the system.
- The system already supports realistic reservation flows.

CONCLUSION

Prestige Events successfully integrates interface design, business rules, and persistent data management. The combination of JavaFX, SOLID principles, and a layered architecture results in a maintainable and extendable system.

The next steps include:

- Adding payment integration
- Improving the user interface
